Solving Problems at School

Abhijit: Shiksha shakti bhogadhar

Amit, along with his friends, was getting frustrated with his school assignments.

Amit: Abhijit, I am finding it difficult to solve these math problems.

Abhijit: Let me see if I can help.

Amit: Thank you, Abhijit.

Abhijit: Do you have a specific problem you want to solve?

Amit: Yes, I have problems with these two equations:

1. 2x + 3 = 7
2. 4y - 5 = 11

Abhijit: Let me explain.

Amit: Please.

Abhijit: First, we need to isolate the variable on one side of the equation.

Amit: How do we do that?

Abhijit: For equation 1, we can subtract 3 from both sides:

2x + 3 - 3 = 7 - 3

Amit: Okay, so...

Abhijit: Now, divide both sides by 2:

2x/2 = 4/2

Amit: So, x = 2.

Abhijit: Exactly. Now, let's do it for the second equation:

4y - 5 + 5 = 11 + 5

Amit: And then...

Abhijit: Divide both sides by 4:

4y/4 = 16/4

Amit: So, y = 4.

Abhijit: Correct. Now, we have solved both equations.

Amit: Thank you, Abhijit. You really helped.

Abhijit: No problem. If you have any more questions, feel free to ask.

Amit: I will.

Abhijit: Good. Keep practicing.

Amit: I will. Thanks again.

Abhijit: Anytime. Keep going!
